

Animal filter App

You need to create an app where you can add animals and list them. On load you grab animals from localStorage if you have some, otherwise you should see a message that no animals added and button **Add animal** which opens a **Add form**.

In form you have three fields

- Animal name
- Animal image src
- Animal species (select or input)

In animal species field you need to choose species from previous defined animals or create a new one. When you press **add new species** select element needs to be replaced with an input element.

Validation is required!

Wireframe attached at the bottom!

Bonus:

Default language of this app is English, you need to add an option to add a new language . In order to carry out a word translation there, a new page is needed (*/translations*). In this page you will see all translations and will have an ability to translate it.

Example:

Lion	ENG	Lion
	LV	Lauva
	RUS	Лев
Dog	ENG	Dog
	LV	<i>empty</i>
	RUS	<i>empty</i>
